FP--General--AMEDD

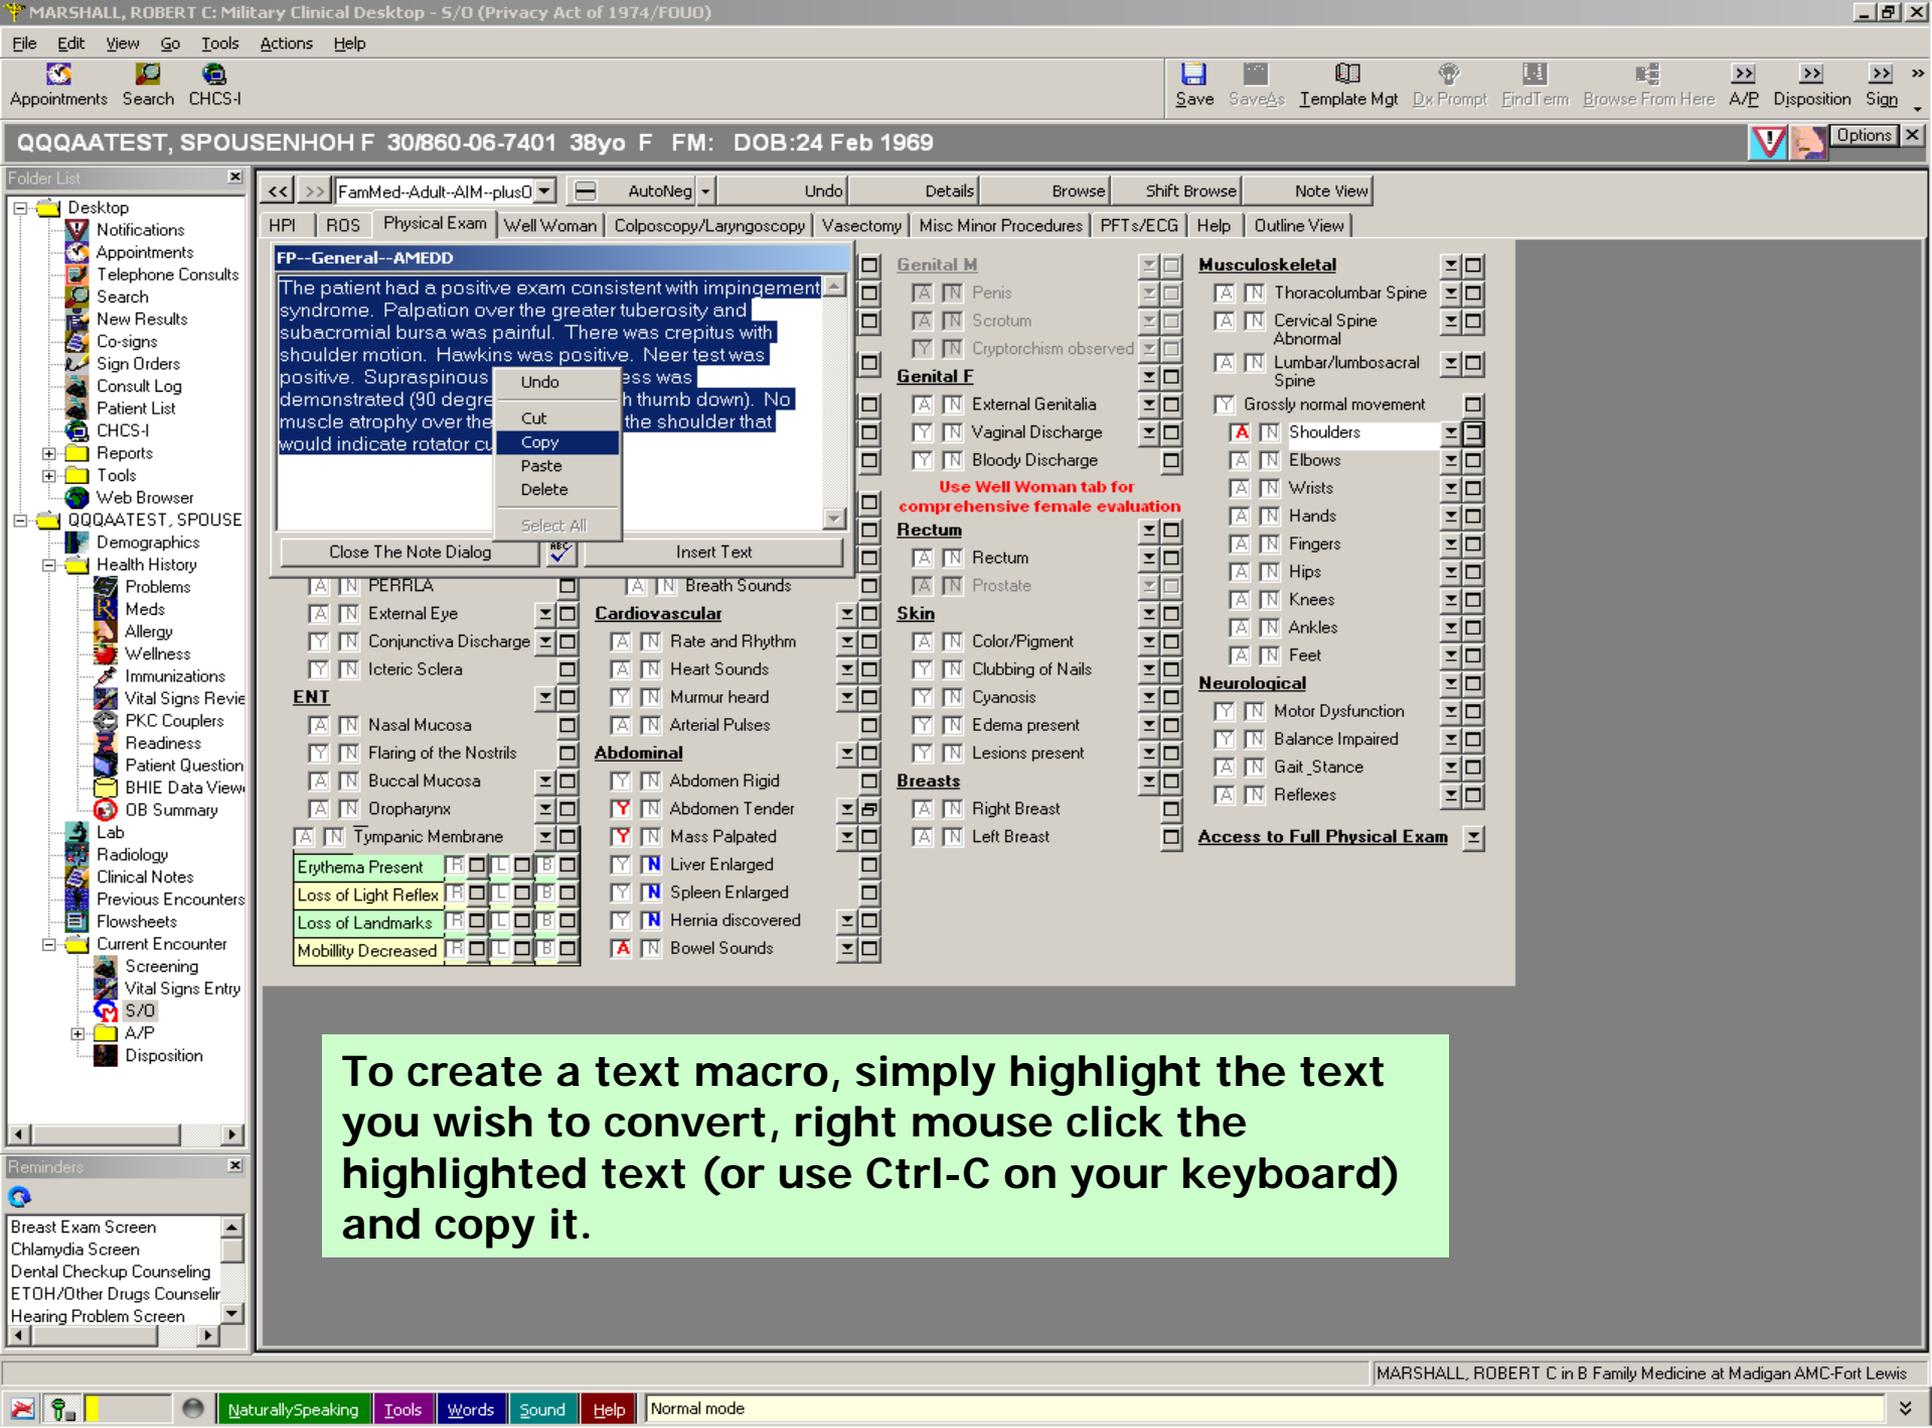

The patient had a positive exam consistent with impingement syndrome. Palpation over the greater tuberosity and subacromial bursa was painful. There was crepitus with shoulder motion. Hawkins was positive. Neer test was positive. Supraspinous tendon weakness was demonstrated (90 degree elevation with thumb down). No muscle atrophy over the top or back of the shoulder that would indicate rotator cuff tear.

Here is an example of a physical exam that would make a good text macro. This is for impingement syndrome. Any history, physical exam or procedure text that could be repetitive between patients is a good candidate for a Dragon text macro.

FP--General--AMEDD

The patient had a positive exam consistent with impingement syndrome. Palpation over the greater tuberosity and subacromial bursa was painful. There was crepitus with shoulder motion. Hawkins was positive. Neer test was positive. Supraspinous tenderness was demonstrated (90 degree flexion with thumb down). No muscle atrophy over the shoulder. The shoulder that would indicate rotator cuff tear.
